This is a 5-day class

This course aims at enabling learners to study and configure Cisco IOS Software IP version 6 (IPv6) features. The course is a technology course covering IPv6 design and implementation topics.

Course Objectives

Describe the factors that led to the development of IPv6, and the possible usages of this new IP structure
Explore the structure of the IPv6 address format, how IPv6 interacts with link-layer technologies, and how IPv6 is supported in Cisco IOS software
Describe the nature of changes to DNS and DHCP to support IPv6, and how networks can be renumbered using both services
Understand the updates to IPv4 routing protocols needed to support IPv6 topologies
Understand multicast concepts and IPv6 multicast specifics
Describe IPv6 transition mechanisms and which methods will be most effective in your network
Examine security issues, how security for IPv6 is different than for IPv4, and emerging practices for IPv6-enabled networks
Describe the standards bodies that define IPv6 address allocation, as well as one of the leading IPv6 deployment issues, multihoming
Describe the deployment strategies service providers are facing when deploying IPv6
Explore case studies for enterprise, service provider, branch, and access networks

Other Prerequisites
